

DELIVERABLE ID: GHLSYS01

Technical Implementation Report

DOCUMENT TYPE	ORGANIZATION
Implementation Report	B2B AI SaaS Company (Anonymized)
PLATFORM	SYSTEM SCOPE
GoHighLevel	Lead Intake & Booking
IMPLEMENTATION PERIOD	EXECUTION STATUS
August - September 2025	Workflow Validated
DOCUMENT VERSION	DOCUMENT DATE
v1.0	July 2026

Executive Summary

This implementation report documents the design, configuration, and validation of the Lead Capture to Booking System developed for a B2B AI SaaS company. The documentation presents the complete implementation details, including system architecture, data structure mappings, automation logic, operational settings, and supporting validation records.

CONFIDENTIALITY & ANONYMIZATION NOTICE

Certain organization-specific data, proprietary templates, and contact credentials have been intentionally anonymized or replaced with standard mocks to protect client confidentiality while preserving the technical integrity of the system architecture.

Implementation Summary

Parameter	Specification Details
Business Domain	B2B AI Software-as-a-Service (SaaS)
Core Platform	GoHighLevel (CRM, Workflows, Forms, Calendar widgets)
Implementation Type	Lead Intake, Field Validation, & Consultation Booking System
Implementation Scope	Lead Capture Form, Database Contact Model, Email Trigger Notifications, Calendar Synchronization
Execution Status	Workflow Validated (Tested and Ready for Deployment)

Part 01: Business Context & Project Scope

Business Problem

Prior to the implementation, the client managed inbound sales leads using separate tools for form collection, email follow-ups, and calendar scheduling. This manual coordination created a significant delay between lead intake and consultation booking, leading to drop-offs. There was also a lack of standard contact fields, causing inconsistent database entries and calendar scheduling collisions.

Objectives

The primary objectives of this implementation are:

- Improve lead intake consistency by enforcing standard required fields.
- Reduce manual coordination overhead by automating booking notifications.
- Automate appointment scheduling through GHL's native calendar widgets.
- Standardize booking operations to eliminate scheduling conflicts and timezone baselines.

Project Scope

In Scope	Out of Scope
• Lead Capture Landing Page & GHL Custom Form • Contact Data Model customization • Automated Intake and Confirmation Workflows • GHL Calendar Setup & Google Calendar integration • Confirmation email template mapping	• Advanced outbound sales pipelines • Paid consultation processing integration • Third-party platform custom API integrations

Constraints & Assumptions

- **Platform Boundaries:** Design options are constrained by GoHighLevel's native form designer and email visual builder.

- **Google Calendar Permissions:** Two-way sync assumes the consultant maintains an active Google Workspace account with appropriate OAuth permissions.

Part 02: Technical Architecture & Design Decisions

The system uses a direct trigger-action architecture. When a lead submits the intake form on the landing page, GoHighLevel creates or updates the contact record. This contact creation event triggers the intake workflow, which sends immediate confirmations and routes the user to the scheduling calendar.

- **Why GoHighLevel (Unified Platform):** We chose GoHighLevel to keep CRM records, landing pages, forms, and calendars in one unified system. This avoids the need for external connection tools (like Zapier), removing third-party points of failure.
- **Why Native Workflows:** Building native GHL workflows simplifies the stack. It ensures that contacts are updated instantly and triggers fire within milliseconds of form submissions.
- **Two-way Calendar Integration:** We selected a native two-way Google Calendar sync. GHL checks the consultant's real-time Google Calendar availability before showing booking times, and writes new appointments directly back to the consultant's Google Calendar.
- **Trade-offs:** While GHL's native form and email builder restricts custom styling layouts compared to a custom React/HTML build, we accepted this constraint to gain faster deployment speeds and easier maintenance.

Part 03: Contact Data Structure

The contact data model enforces consistency across all inbound lead captures. The table below lists the custom and standard fields configured in the database:

Field Name	Required	Validation	Used By	Example Value
First Name	Yes	Standard Text	Contact Creation, Personalization	John
Last Name	Yes	Standard Text	Contact Creation	Doe
Email	Yes	Standard Email Format	Workflow Trigger, Booking Confirmation	john.doe@example.com
Phone Number	No	E.164 Format Validation	SMS Notifications (Optional)	+15550199283
Lead Source	No	Drop-down Menu	Analytics, Pipeline Tracking	Website Inbound
Consultation Date	No (Set on booking)	ISO Date format	Calendar Sync, Reminders	2025-09-15
Consultation Time	No (Set on booking)	ISO Time format	Calendar Sync, Reminders	14:30:00
Meeting Link	No (Auto-generated)	Valid URL	Email Templates, Reminders	https://zoom.us/j/123456789

Part 04: Automated Workflow Sequences & Failure Handling

Automation Sequences

Two core workflows are configured inside the GoHighLevel automation engine:

1. **Lead Intake Workflow:** Triggered on form submission. It updates the contact status, logs the lead source, and schedules an initial confirmation email containing the calendar booking link.
2. **Consultation Booking Workflow:** Triggered when an appointment is booked on the calendar widget. It sends the calendar invite, writes the meeting link to the contact record, and schedules the email reminder sequence.

Calendar Booking workflow

Failure Handling Logic

- **Validation Failures:** If a user enters an invalid phone number format, the system routes the communication to an email-only fallback workflow to prevent automation execution errors.
- **No Booking Slots Available:** If no booking slots are available on the calendar widget, users are presented with the calendar's native availability rules. Manual follow-up may be required depending on the booking configuration.

Part 05: Calendar Synchronization & Operational Notes

The calendar system integrates directly with Google Calendar to prevent scheduling conflicts and automate slot availability based on real-time schedule checks.

Operational Decisions

- **Calendar Rules:** Minimum scheduling notice and slot availability constraints are governed by native calendar configurations to prevent schedule overlaps and last-minute booking surprises.
- **Timezone Mappings:** Timezone conversions are handled natively by GHL. The scheduling widget displays availability in the lead's local browser timezone and automatically converts it to the consultant's calendar timezone upon booking.

Part 06: Implementation Review & Outcomes

Verification Checklist

The system underwent a rigorous validation phase to verify workflow triggers and data synchronization. The following tests were performed and validated:

- **[Pass]** Form submission validation (ensuring fields capture and write to CRM successfully).
- **[Pass]** Contact record creation (new contact created; existing contact merged).
- **[Pass]** Workflow trigger execution (validating form submission triggers GHL workflow actions).
- **[Pass]** Calendar booking creation (booking writes slot block directly in GoHighLevel).
- **[Pass]** Confirmation email delivery (validating email templates merge custom variables correctly).
- **[Pass]** Google Calendar synchronization (checking two-way sync blocks unavailable times).

Known Limitations

- **Native Form Customization:** GHL form styling is constrained by native custom field CSS controls, which limits advanced pixel-perfect responsive alignments.
- **Native Workflow Branching Limits:** If-else conditions are limited to native contact fields, requiring tags for complex conditional routing.
- **Platform-Dependent Booking:** Booking layouts are locked to GHL's native templates.

Lessons Learned

- **Native Workflows Save Time:** Prioritizing native platform features over third-party API configurations reduces maintenance complexity and point-failure risks.
- **Data Validation is Key:** Setting early data validation rules on forms prevents downstream email/SMS delivery failures and data pollution.
- **Centralization Simplifies Operations:** Maintaining leads, calendar availability, and automated sequences in one system simplifies overall platform management.

Implementation Outcome

The implementation established a standardized workflow for lead intake, appointment scheduling, and notification management using GoHighLevel's native capabilities.

The resulting solution reduced dependency on manual coordination by centralizing contact capture, workflow execution, and booking management into a structured operational process.

The implementation also produced reusable documentation, architecture diagrams, workflow evidence, and implementation artifacts suitable for future maintenance and knowledge transfer.
